Mikkel Damm Vind

Senior Full-Stack Developer · Next.js, React & Node.js · Frontend roots, full-stack reach

Copenhagen, Capital Region of Denmark, Denmark

Summary

I'm a self-taught developer with 16+ years of experience building everything from large-scale booking platforms to SaaS products — and I've spent most of that time trying to make things both work well and look good. That combination of solid engineering and a real eye for design is what I'm most proud of. Most devs either care about the code or the look. I care about both. Over the years I've worked at places like DFDS — where I helped move an 80-person dev team towards modern frontend — and Dinero, where I was part of rebuilding their core platform as a full Angular SPA. These days I run Coding Moon and lead development at Målbar, where I build LCA tooling from the ground up. I try to build things that are simple to understand and easy to maintain — not just for me, but for whoever touches the code next. If you need help with something, I'm happy to have a chat.

Experience

MÅLBAR

Lead Software Developer

June 2023 - Present (3 years 1 month)

Copenhagen

Målbar is a Danish sustainability platform helping companies measure and reduce their environmental impact through life cycle assessment.

I've built the core web tool from the ground up — database, backend, frontend, queues, and result calculation engine — translating what started as a complex Excel-based screening tool into a full web application anyone can use.

Alongside the user-facing tool, I also built an entire admin and content platform where the team can construct and manage the materials, processes, and datasets that power the calculations. Everything from scratch, every layer of the stack.

Coding Moon

Software Developer & Owner

October 2018 - Present (7 years 9 months)

Copenhagen Municipality

Coding Moon is my own development studio — where I take on freelance projects for other companies and build my own products on the side.

Client work has included building the core platform at Målbar from scratch, developing internal web application tools and the public website big.dk for Bjarke Ingels Group, an internal dashboard for accounting firm Zignifikant, and CRM integrations for Spilbræt.

On the side I've been building my own products: Ønsker.dk (a wishlist platform), Instabolid (a web app that tracks estate listings from realtors' Instagram accounts and notifies users of new ones), and two apps currently in progress — a playground finder and a local grocery discovery app.

eManager

Founder & CTO

December 2018 - October 2021 (2 years 11 months)

Co-founded an esports startup where I served as CTO and built the platform from scratch. The core product was a manager game built on top of real Counter-Strike events — players, matches, and tournaments happening live.

Over time it evolved into a broader content platform with external partner integrations, and we grew to a team of 5 people and raised 1 million DKK in capital.

Dinero

Senior Frontend Developer

September 2016 - October 2019 (3 years 2 months)

København V

Dinero is one of Denmark's leading cloud-based accounting platforms for small businesses.

I joined to help modernise the frontend — starting the transition from an old Backbone codebase to a full Angular SPA, and contributing to a broader UX and design overhaul of the platform.

Some of the features I owned and shipped: the kassekladde (which had seen a few failed attempts before landing on my plate) and the bankafstemning — both core accounting features used daily by thousands of users.

I also worked on backend services in Node.js deployed on Docker, and helped move the test suite from Selenium to Cypress.

DFDS

Frontend developer

February 2015 - September 2016 (1 year 8 months)

Copenhagen Metropolitan Area

I joined to help bring modern frontend thinking into an organisation of 80+ developers — mostly C# backend engineers — as DFDS was making a serious push towards digital. My main project was a complete rebuild of dfds.com, starting in SharePoint with Angular modules and eventually moving to a headless CMS with static pages built on React.

I also worked on rewriting parts of the passenger booking platform from .NET MVC to a full Angular SPA, running it side by side with the existing system.

Beyond the code, I was part of a digital strategy committee — helping train the wider organisation in clean code and testing practices. It put me in a position where I was as much an advocate for good engineering culture as I was a developer.

Group Online A/S

Full-stack Developer

February 2008 - January 2015 (7 years)

I came in as a designer, but my interest in JavaScript and HTML quickly moved me over to the engineering side.

Together with a colleague, I built a new CMS from scratch in .NET in our spare time and handed it to the company. It became their main product — and was eventually sold for a significant sum years later.

From there I grew into a lead developer role, heading a team of 8 across Denmark and Ukraine. My main focus was architecture and frontend, alongside setting up testing procedures and introducing Scrum to fit how the team actually worked.

Education

Frederiksberg HTX

High School Diploma, Information Technology · (2006 - 2009)
